AI software for quantitative analysis of the Nigrosome region

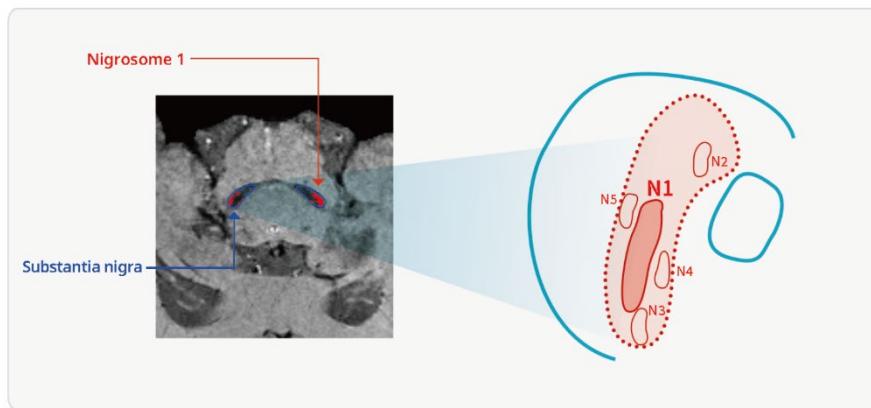

Heuron NI

Heuron NI provides quantitative results allowing longitudinal analysis of Parkinson's disease progression

MFDS Class 2, Certification n° 21-4520

Heuron NI measures the volume of the nNigrosome areas

- Contouring of anatomical structures, Substantia nigra and Nigrosome areas, in the midbrain region.

Heuron NI consists of an AI neural network model that automatically identifies and segments the region to produce quantified results

- A convolutional neural network(CNN) model trained using a large quantity of brain MR images.
- The highlighted Nigrosome region indicates the size of the hyperintense area over the pre-set threshold.
- Clinicians can manually adjust and contour the Nigrosome areas.
